Ricardo Benthem

LinkedIn Iron quiz

I come from Málaga, Spain.

A wonderful city where, even though summer has already passed, it's still hot.

my hobbies are playing guitar and programing in different languages as python, golang, js and ts.

My project is a LinkedIn test simulator. It occurred to me because, often, you have to complete a test before submitting a job application.

It works like a single page test that give the results after answering the 25 questions.

The biggest challenge I encountered was that some questions came with a block of text between the question and the answer options, and this didn't render properly.

I tried converting them to Markdown, but the result wasn't good, and given the large number of questions, I decided to omit those.

I think my biggest mistake was probably using GSAP animations for the answers, as they almost never aligned correctly with the container `div`.

From that, I learned that things don't always have to be perfect so I rounded the answer container.
